

HOW TO USE IT

Your lead scraper, start to finish

Ask Claude for a state and a type of business. You get back a verified email list, ready for Instantly.

~20%

of businesses scraped end up as a verified, contactable email

~\$6

on Apify per 1,000 businesses, plus 1 MillionVerifier credit per email

10–60 min

for a full state, running on its own after you say yes

01 · ONCE, ABOUT 10 MINUTES

Set it up

No terminal needed. Claude does the setup, and your only job is pasting two keys.

- 01 **Install Claude Code in VS Code.** Open VS Code, click the Extensions icon in the left sidebar, search `Claude Code`, click Install, then sign in with your Claude account.
- 02 **Make an empty folder and open it.** In VS Code go to File → Open Folder, create a new folder called `Lead Scraper` (in Documents is fine) and open it. Then click the Claude icon to open a chat.
- 03 **Paste this prompt into the chat** and press Enter:

Set up the Blue Wave AI lead scraper in this folder. Clone <https://github.com/jun-qwickstep/bluewave-lead-scraper> directly into the current folder, create my `.env` file from `.env.example`, and open `.env` so I can paste my keys. If git or Python 3 is missing, or GitHub asks me to sign in, walk me through it step by step. When you're done, tell me exactly where to paste each key.
- 04 **Paste your two keys** into the `.env` file Claude opened, right after the `=` signs, then save (Cmd+S).

LINE IN .ENV

WHERE TO COPY IT FROM

APIFY_TOKEN=

console.apify.com → switch to the BlueWaveAI account → Settings → API & Integrations

MILLION_VERIFIER_API_KEY=

app.millionverifier.com → API in the left menu

- 05 **Start a new Claude chat and check.** Click `+` for a new chat, then say `check my setup`. Claude confirms the keys work and which Apify account they belong to. That's it, you're ready.

02 · EVERY TIME

Run a scrape

You make three decisions. Claude handles the rest.

01 **Ask for what you want.**

Scrape flooring stores in Texas

02 **Answer a few questions.** Claude fills in sensible defaults, so you can say yes or change one thing.

INPUT	WHAT IT MEANS	DEFAULT
Segment	Flooring retailers or epoxy / coating contractors	You choose
State(s)	One batch per state. It covers the whole state, no cities needed	You choose
Search terms	What gets typed into Google Maps. The core 5 cover most shops	Core 5
Places per term	How deep to go. Small state 150, mid 300, CA / TX / FL 600–1,000	300

03 **Approve the cost.** You see the most it can spend on Apify, the MillionVerifier credits and your balances. **Nothing runs until you say yes,** and the Apify run has a hard cap, so it can't go over that number.

04 **Scrape.** Google Maps is searched across the whole state, and the emails listed on each business's website are collected.

05 **Clean.** Closed businesses, no-website listings, wrong categories (carpet cleaners, remodelers, furniture stores), junk emails, and anyone already in an earlier list are removed.

06 **Verify.** Every email is checked by MillionVerifier. Only emails that pass make the list. Risky and invalid ones are dropped, so nothing on it should bounce.

07 **Get your list.** Claude tells you what came out and where the file is.

The same store never lands on two lists. Each run checks every earlier list in `leads/clean/`. Don't delete those files, because they're how the scraper remembers who has already been contacted.

03 · YOUR FOLDER

What's in here, and what to ignore

Three documents sit at the top, and **leads/** is the only folder you open. The rest is machinery.

leads/clean/	Your finished lists. One CSV per scrape, verified emails only. Import these into Instantly.	OPEN THIS
leads/raw/	Everything Google Maps returned, before cleaning.	RARELY
leads/runs.csv	A log of every scrape: date, state, cost, counts.	IF CURIOUS
.env	Your two API keys. Pasted once at setup, then forget it.	SETUP ONLY
config/	Search terms and settings. Ask Claude to change them.	ASK CLAUDE
.claude/	The skill itself, what Claude reads to run a scrape.	IGNORE
docs/	The design files these PDFs were made from.	IGNORE
README.md	The setup steps, shown on the GitHub page.	IGNORE

leads/clean/2026-09-24_TX_flooring_clean-712.csv = the Texas flooring list from Sept 24, 712 verified emails. **Never delete anything in leads/clean/**, it's how the scraper remembers who has already been contacted.

04 · EXPECTATIONS

From the first live test

1,000 businesses found	100%
~770 have a website	77%
~270 list an email	27%
~200 verified and ready	20%

Arizona flooring, 30 businesses. Treat it as a rough guide until a full state has run.

05 · GOOD TO KNOW

Before your first run

- **Most emails are shared inboxes** like info@ or office@. That's normal at this size, and they're tagged **generic**.
- **No revenue or owner names.** Google Maps doesn't have them. Sort by review count instead.
- **Chains are flagged, not removed.** Filter **known_chain** if you don't want them.
- **Apify's free plan (\$5/mo) is for tests.** A full state needs a paid plan.

06 · HANDY PROMPTS

Things you can say

How much would Florida coating cost?

Which states have I already done?

Is the Texas scrape done yet?

Drop franchises from the next run
